                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        collateral circulation in tissue infarction or arterial stenosis,
Such as coronary artery disease, and inhibition of angiogenesis in
the treatment of cancer or of diabetic retinopathy. It can also be
used in the treatment of lung disorders to improve blood circulation
cin the lung and/or gaseous exchange between the lungs and the blood
stream or to improve blood circulation to the heart and O2 gas
permeability in cases of cardiac insufficiency, to improve blood
flow and gaseous exchange in chronic obstructive airway disease,
or to treat malabsorptive syndromes in the intestinal tract.
Countitation of VEGF-D in cancer biopsy specimens may be useful
as an indicator of future metastatic risk. Antagonists can be used
for treating e.g. conditions such as congestive heart failure,
involving accumulations of fluid in the lung resulting from
increases in vascular permeability. The products can also be used
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Matches

             This invention describes a novel vascular endothelial growth factor-X (VEGF-X) protein (Ia) and its encoding polynucleotide (IIa) which has vulnerary, cytostatic, antirheumatic, antiarthritic, antipsoriatic and antidiabetic activity and acts as an anglogenesis and vascularization regulator. An antisense molecule of the invention is useful for treating
                                                                                                                                                                                                                                 New vascular endothelial growth factor protein, useful for treating or preventing diseases associated with inappropriate angiogenesis activity such as cancer, rheumatoid arthritis, psoriasis and wounds -
                                                                                                                                                                                                                                                                                                                                                WPI; 2000-442669/38

The products of the invention are useful for preparing medicaments for treating wounds such as dermal ulcers, pressure sores, venous sores, diabetic ulcers and burns and to promote skin graft growth, tissue repair, proliferation of new blood vessels, tissue regeneration and organ repair by promoting angiogenic activity or vascularization. This sequence represents the human VEGD protein used to illustrate the method of the invention.
                                                                                                                                                                                                  Screening

present sequence is

the protein sequence

of the

human

The patent discloses a method to treat neoplastic disease characte by expression of fms-like tyrosine kinase 4 (Flt4) receptor (also referred as vascular endothelial growth factor receptor-3, VEGFR-3 endothelial cells of blood vessels adjacent to malignant neoplasm. method involves administering a compound that inhibits binding of

characterised VEGFR-3) in

                                                                                                Treating neoplastic diseases such as lymphoma, carcinomas, melanomas and sarcomas, involves administering a compound capable of inhibiting binding of ligand proteins to fms-like tyrosine kinase-4 receptor -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  endothelial growth factor D (VEGF-D). It was used to demonstrate the methods of the invention, which involve the screening of individuals to determine which vascular endothelial growth factor receptor 3 (VEGFR-3, also known as F114 or fms-like tyrosine kinase 4) alleles they possess and thus their likelihood of developing hereditary lymphoedema. Conditions associated with lymphoedema include Milroy-Nonne syndrome, which is early onset lymphoedema and lymphoedema praecox, which is late

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          endothelial cells. The compound is useful for treating neoplastic disease such as breast carcinomas, squamous cell carcinomas, lymphomas, melanomas and sarcomas. Plt4 receptor tyrosine kinase binding compounds can be used for manufacturing medicament useful for diagnostic screening, imaging and treatment of malignancies characterised by Flt4-expressing blood cells. The Flt4 gene maps to chromosomal region 5q35 and is expressed as 5.8 kb and 4.5 kb mRNAs which differ in their 3' sequences and are differentially expressed in HEL and DAMI cell lines. Flt4 belongs to a subfamily of class III receptor tyrosine kinases (RTKs). It is used as a target for tumour imaging and anti-tumour therapy. The present sequence is a human prepro-vascular endothelial growth factor D (VEGF-D), a specific example of Flt4 binding compound. A recombinantly matured VEGF-D lacking residues 1-92 and 202-354

VEGF-D has the ability to stimulate re-endothelialisation of an injured blood vessel, without significant stimulation of smooth muscle cell proliferation. It can bind to and stimulate VEGFR-2 (vascular endothelial growth factor receptor) and/or VEGFR-3 phosphorylation in cells that express such receptors. An anti-restenosis agent comprising either a VEGF-D gene or protein is used in a method to reduce or prevent restenosis and stenosis of a blo vessel following vascular trauma e.g., cardiovascular surgery and percutaneous transluminal coronary angioplasty.

                                                                                                                                                                                                                                                                                                                    Matches 153;
                                                                                                                                                                                                                                                                                                                                                                                                                   lymph)angiogenesis. The proteins are also used to identify specific binding agents (potential therapeutic agents) and to raise antibodies. The antibodies are useful as therapeutic (ant)agonists; for detection, purification and targeting of proteins for in vivo or in vitro diagnosis (including imaging) or for therapy (including when linked to e.g. a label or cytotoxin); and for immunotyping of cells, e.g. for detecting minimal residual disease or haematopoietic progenitor/stem cells. It is also contemplated that the sequences might be useful for treating a very wide range of other disorders, e.g. autoimmune diseases; allergy; cancer; infectious diseases (viral, bacterial, fungal or parasitic); neurodegeneration, also as chemotactic agents or for stimulating
            Human VEGF-D
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        detecting mutations or the presence or amount of angiogenic protein expression. Particularly they are used to stimulate wound healing, growth of damaged bone and tissue, and for repair of vascular tissue, especially peripheral arterial disease, critical limb ischaemia or coronary disease. Antagonists of the sequences are used to inhibit angiogenesis in tumours and to treat inflammation (where associated with increased vascular respectively).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New nucleic acid encoding angiogenic proteins, useful e.g. for promoting healing of wounds and treating peripheral arterial disease, critical limb ischaemia or coronary disease -

The present invention relates to a method for screening a human subject CC for an increased risk of developing a lymphatic disorder e.g. hereditary CY lymphedoema. The method comprises assaying nucleic acid of a human Subject to determine a presence or an absence of a mutation altering the Sequence or expression of vascular endothelial growth factor receptor-3 CY (VEGFR-3)/fms-like tyrosine kinase 4 (Flt4) allele (see AAC68952 and CY AAB37604) and determining an increased risk of developing lymphatic CY disorder from presence or absence of the mutation. The presence of a mutation altering the encoded amino acid sequence or expression of at least 1 VEGFR-3 allele. In the nucleic acid sequence or expression of at 1.3 (1) vegence of the mutation altering the encoded amino acid sequence or expression of at cleast 1 VEGFR-3 allele. In the nucleic acid correlates with an increased risk of developing a lymphatic disorder. Treatment for hereditary 1.3 (1) vegence can be provided through the administration of vascular endothelial growth factor C (VEGF-C) and proteins. The present sequence is the protein sequence for VEGF-D.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Matches

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention describes a method for inducing angiogenesis in a tissue, or area, in need of angiogenesis, in a mammal. The method comprises administering recombinant vascular endothelial growth factor [VEGF-D] or its angiogenically active fragment or mutant (I). The present sequence represents the human VEGF-D protein, which can be used in the method of the invention. (I) has cardiant and vasotropic activities, and is an angiogenesis inducer. The method can be used for inducing angiogenesis in a tissue in need of angiogenesis, or in an area in need of angiogenesis in a tissue in need of angiogenesis in a tissue in need of angiogenesis in a tissue in sectual for treating various ischaemic conditions manifested by vascular insufficiency such as peripheral vascular disease, coronary artery disease or myocardial

It could be implicated in tumours and development. Recombinant FIGF can be produced in transformed host (e.g. CHO) cells. It can be used to identify its receptors and in an assay for the identification of agonists and antagonists. Antibodies raised against FIGF can be used to block the function of the protein and thereby inhibit or suppress tumour growth. Transgenianimals expressing FIGF can be generated for use e.g. as models in the protein and thereby inhibit or suppress tumour growth.
                                                                                                                                                                                                                                                                                                                                                             3 Polypeptide sequences (AAW14993-95) are the respective translated sequences of reading frames 1, 2 and 3 of clone HF175 (AAT62961), th human homologue of murine clone F0401 (AAT62960), which codes for a novel c-Fos induced growth factor (FIGF) (see also AAW14992). Examination of the 3 polypeptides indicates that reading frame 2 has the longest region free of nonsense codons. FIGF is a C-fos-dependent autocrine growth factor able to induce cell division
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Nucleotide molecule encoding c-Fos induced growth factor protein useful in therapy, in manufacture of compositions for treatment developmental disorders and in generation of transgenic animal
                                                                                                                                                                                                                     Sequence

                                                                                                                                                                                                                                                                                                                    This invention describes the novel preparation of biologically active dimers of recombinant human growth factors of the cysteine knot family starting from cellular inclusion bodies. Such dimers are are useful in pharmaceutical compositions and the method provides yields of 31-39.7%, in examples, compared with about 10% for the conventional method (see Biochemistry, 28 (1989) 2956). AAX08278-708301 are human growth factor protein fragments used in the method of the invention.

It is encoded by the F0401 gene (AAT62960) obtd. from mouse fibroblast cells. FIGF is a c-fosentry and, when over-expressed, a transformed phenotype in fibroblasts. It could be implicated in tumours and development. Recombinant FIGF can be produced in transformed host (e.g. CHO) cells. It can be used to identify its receptors and in an assay for the identification of agonists and antagonists. Antibodies raised against FIGF can be used to block the function of the protein and thereby inhibit or suppress tumour growth. Transgenic animals expressing FIGF can be generated for use e.g. as models for research
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Key
